

Hotel Food Ordering System

Mini Project Presentation-Computer Science & Engg

C Programming

Console Application

What is It?

- **A console based C application that automates food ordering in hotels from menu display to bill generations**

1. View Menu
2. Select items
3. Place order
4. Get Bill

What is the Problem???

1. Communication Friction & Order Inaccuracy

- **The Traditional Problem:** Accents, spotty phone lines, background noise, or a busy operator handwriting notes lead to incorrect orders. A guest asks for "no onions," but it never gets written down, resulting in wasted food and an angry guest.

2. The Kitchen "Black Box" (Zero Status Tracking)

- **The Traditional Problem:** Once a guest hangs up the phone, they have no idea what is happening. Did the kitchen receive it? Is it coming in 10 minutes or 45? This results in guests calling back repeatedly to ask, "Where is my food?", tying up the phone lines.

3. Billing Disconnect & Revenue Leakage

- **The Traditional Problem:** In a traditional setup, the kitchen writes a paper ticket, which eventually needs to make its way down to the front desk accountant to be manually typed into the guest's main room bill at checkout. It is incredibly easy for paper tickets to get lost, misread, or delayed, meaning the hotel often forgets to charge the guest for a meal entirely.

Why should we solve it?

- **1. Protecting the Bottom Line (Revenue & Waste)**

- In the hotel industry, margins on food are tight, and mistakes are expensive.
- **Eliminating Billing Leaks:** With paper tickets, it is remarkably common for a guest to order a \$30 dinner, but the kitchen forgets to hand the slip to the front desk. The guest checks out, and the hotel loses that revenue entirely. A digital system ensures the charge is written to orders.txt the *second* the order is placed.
- **2. Operational Efficiency (Doing More with Less Staff)**
- Labor is one of a hotel's highest expenses.
- During peak hours (like 8:00 AM breakfast), phone lines get jammed. If you have 50 rooms trying to call one or two front desk agents, guests get put on hold, get frustrated, and give up—meaning the hotel loses out on room service sales.

Project Objectives

☐ Automate Ordering

- Replace manual Order taking with a digital process

☐ Fast Billing

- Generate accurate bills in seconds

☐ Reduce Errors

- Eliminate billing mistakes and human error

☐ Better experience

- Improve service speed and customer satisfaction

The problem we're solving

Why it Matters?

- *Manual systems are slow ,error-prone & don't scale .A digital solution addresses all 4 pain points directly*
 - ✓ *Slow manual order-taking*
 - ✓ *Billing errors & lost records*
 - ✓ *Hard to manage peak hours*
 - ✓ *Paper based ineficiency*

Technologies used

Language

C Programming

Compiler

Dev C++

Platform

Console Application

System Features

System Features

Menu Display

Order Selection

Quantity Input

Auto Billing

Fast Processing

Simple UI

System Flowchart

Select item

Choose product & set
quantity

Display Menu

Show items with prices &
categories

Calculate Total

Apply taxes ,discounts &
Sum.

Generate Bill

Issue receipt & exit system

Detailed Flowchart

place_order() Sub-flow

cancel_from_order() Sub-flow

Food items in the menu

Spring Rolls

Paneer tikka

Club Sandwich

Hakka Noodles

Future Enhancements

Roadmap

Planned upgrades to transform this console app into a full-featured hospitality platform.

- Online ordering & mobile app
- Digital payment integration
- Database for order history
- Table reservation system

Conclusion

The Hotel Food Ordering System demonstrates how a **simple C program** can solve real-world hospitality challenges – improving speed, accuracy, and customer satisfaction.

✓ **Efficient**

✓ **Accurate**

✓ **Scalable**

📄 **Thank you – Questions & Answers welcome!**
